

**Anti-small molecules (Chemicals, Antibiotics, Mycotoxins,etc.) antibodies and small molecules competitive antigens
(Carrier-coupled antigen, immunogen, hapten-carrier conjugates, BSA-conjugated, OVA-conjugated), competitive ELISA validated**

 [Full List Download](#)

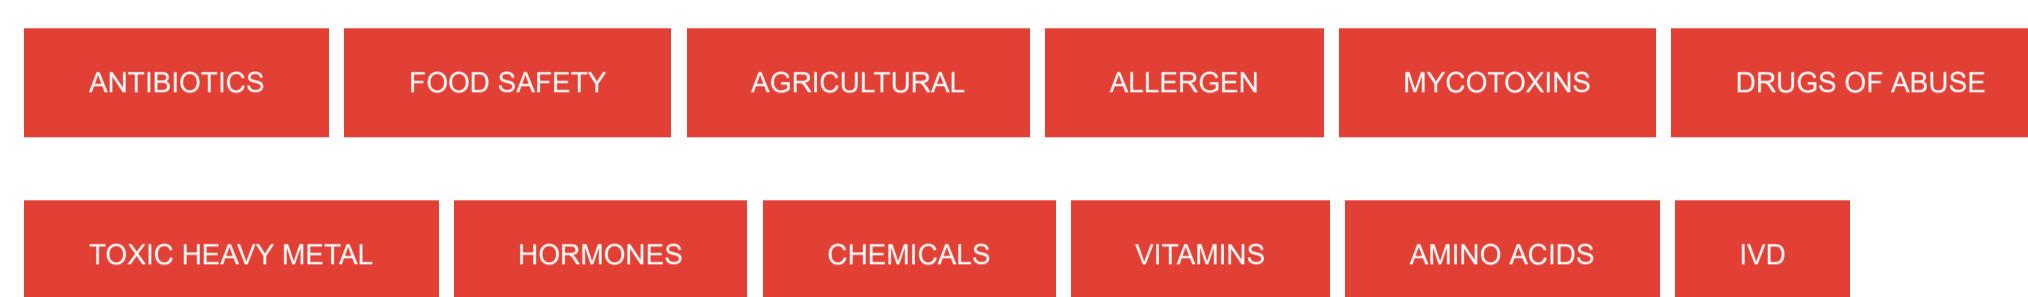

Competitive immunoassay-validated anti-Hapten(small molecules, chemicals) antibody against hapten (small molecules, chemicals) and hapten-carrier conjugated competitive antigens(Carrier-coupled antigen,immunogen,hapten-carrier conjugates, BSA-conjugated, OVA-conjugated).

The anti-Hapten antibodies against haptens had been validated with our hapten-carrier conjugates via competitive ELISA test.

GeneMedi offers paired anti-small molecules (Chemicals, Antibiotics, Mycotoxins, Hormones, Drugs of Abuse, etc.) antibodies (monoclonal antibody, mab) and small molecules competitive antigens (Carrier-coupled antigen, immunogen, hapten-carrier conjugates, BSA-conjugated, OVA-conjugated) for the rapid test and diagnostics kit of Growth Promoters, Toxic Heavy Metal, Myotoxins, Nutritions, Food Safety, Pesticides, Drugs of Abuse, Allergen, Antibiotics, Agricultural, Water Contamination and so on.

All our anti-chemicals antibodies and small molecules hapten-carrier conjugates antigens (BSA-conjugated, OVA-conjugated)are suitable for in competitive ELISA, Lateral flow immunoassay (LFIA) and other immunoassays in diagnostics and rapid test kit. The carrier-coupled antigens of small molecules can act as immunogens.

Genemedi supplies Small Molecule Diagnostic for a wide selection of choices (please see below).

Antibiotics

Diagnostic antibodies and antigens for the detection of maximum residue limit(MRL) of antibiotics

Antibiotics are used for veterinary purposes almost as soon as they had been developed for human medicine. They are supplemented in the animal feed for growth promotion and treatment of infections, which are important during the development of intensive methods of animal husbandry, as a result there are major hazards that could be posed by antibiotic residues in foods like raw milk, poultry, cattle, p0rcine, fish and so on. The possible presence of antimicrobial residues (AR) in farm foods poses a risk for consumers such as allergic reactions, toxicity, carcinogenic effects, selection of resistant bacteria, disruption of human normal flora, provoke immunological response and inhibition of the starter culture.

The risk of residue from these foods are higher in developing countries compared to developed one. This might be related with lack of facilities for detection and regulatory bodies that control the drug residues level in foods in the form of maximum residue limits (MRLs). Therefore, to prevent/minimize the risk of antimicrobial residue in milk, different methods of detection of residue to the standard limits level in all food items is possible by chemical methods, microbiological methods and immunological assays. However, Genemedi developed the antigen and antibody to detect the MRL of various antibiotics in the food such as raw milk, poultry, cattle, p0rcine, fish and so on. Detecting the MRL of different antibiotics from different samples may benefit from ELISA, Lateral flow immunoassay (LFIA), colloidal gold immunochromatographic assay, Chemiluminescent immunoassay (CLIA), turbidimetric inhibition immuno assay (TINIA), immunonephelometry and POCT.

Maximum Residue Limits (MRLs) for Veterinary Drugs in Foods.

Drugs of Abuse

Cat No.	Small molecules (Chemicals, Antibiotics, Mycotoxins, Hormones, Drugs of Abuse, etc.)	Carrier-coupled antigen/immunogen (hapten-carrier conjugates)	Anti-Hapten Antibody	Bioactivity validation	ELISA IC50 Order (ppb)
GMP-SMT-168	Ribavirin(RBV)	BSA-Ribavirin(RBV); OVA-Ribavirin(RBV)	Anti-Ribavirin(RBV) mouse monoclonal antibody	Competitive immunoassay validation (Competitive ELISA) with hapten-carrier conjugates and anti-Hapten antibody;Lateral flow immunoassay (LFIA);	7-8 
GMP-SMT-169	Amantadine(AM)	BSA-Amantadine(AM); OVA-Amantadine(AM)	Anti-Amantadine(AM) mouse monoclonal antibody	Competitive immunoassay validation (Competitive ELISA) with hapten-carrier conjugates and anti-Hapten antibody;Lateral flow immunoassay (LFIA);	10 
GMP-SMT-197	Tolfenamicacid	BSA-Tolfenamicacid; OVA-Tolfenamicacid	Anti-Tolfenamicacid mouse monoclonal antibody	Competitive immunoassay validation (Competitive ELISA) with hapten-carrier conjugates and anti-Hapten antibody;Lateral flow immunoassay (LFIA);	2 
GMP-SMT-198	Carprofen	BSA-Carprofen; OVA-Carprofen	Anti-Carprofen mouse monoclonal antibody	Competitive immunoassay validation (Competitive ELISA) with hapten-carrier conjugates and anti-Hapten antibody;Lateral flow immunoassay (LFIA);	1 
GMP-SMT-199	Flunixin meglumine	BSA-Flunixin meglumine; OVA-Flunixin meglumine	Anti-Flunixin meglumine mouse monoclonal antibody	Competitive immunoassay validation (Competitive ELISA) with hapten-carrier conjugates and anti-Hapten antibody;Lateral flow immunoassay (LFIA);	1 
GMP-SMT-201	Metamizole	BSA-Metamizole ; OVA-Metamizole	Anti-Metamizole goat polyclonal antibody	Competitive immunoassay validation (Competitive ELISA) with hapten-carrier conjugates and anti-Hapten antibody;Lateral flow immunoassay (LFIA);	2 
GMP-SMT-202	Nitrazepam, Clonazepam(CZP)	BSA-Nitrazepam, Clonazepam(CZP); OVA-Nitrazepam, Clonazepam(CZP)	Anti-Nitrazepam, Clonazepam(CZP) mouse monoclonal antibody	Competitive immunoassay validation (Competitive ELISA) with hapten-carrier conjugates and anti-Hapten antibody;Lateral flow immunoassay (LFIA);	0.9-1 
GMP-SMT-203	Diazepam(DZP)	BSA-Diazepam(DZP); OVA-Diazepam(DZP)	Anti-Diazepam(DZP) mouse monoclonal antibody	Competitive immunoassay validation (Competitive ELISA) with hapten-carrier conjugates and anti-Hapten antibody;Lateral flow immunoassay (LFIA);	0.9-1 
GMP-SMT-204	Antipyrine(AP)	BSA-Antipyrine(AP); OVA-Antipyrine(AP)	Anti-Antipyrine(AP) mouse monoclonal antibody	Competitive immunoassay validation (Competitive ELISA) with hapten-carrier conjugates and anti-Hapten antibody;Lateral flow immunoassay (LFIA);	3 
GMP-SMT-205	Indomethacin	BSA-Indomethacin; OVA-Indomethacin	Anti-Indomethacin mouse monoclonal antibody	Competitive immunoassay validation (Competitive ELISA) with hapten-carrier conjugates and anti-Hapten antibody;Lateral flow immunoassay (LFIA);	1 
GMP-SMT-206	melloxacan	BSA-melloxacan; OVA-melloxacan	Anti-melloxacan mouse monoclonal antibody	Competitive immunoassay validation (Competitive ELISA) with hapten-carrier conjugates and anti-Hapten antibody;Lateral flow immunoassay (LFIA);	1 
GMP-SMT-207	Hydrochlorothiazide(DCT)	BSA-Hydrochlorothiazide(DCT); OVA-Hydrochlorothiazide(DCT)	Anti-Hydrochlorothiazide(DCT) mouse monoclonal antibody	Competitive immunoassay validation (Competitive ELISA) with hapten-carrier conjugates and anti-Hapten antibody;Lateral flow immunoassay (LFIA);	0.1-0.2 
GMP-SMT-208	Amlodipine(ADP)	BSA-Amlodipine(ADP); OVA-Amlodipine(ADP)	Anti-Amlodipine(ADP) mouse monoclonal antibody	Competitive immunoassay validation (Competitive ELISA) with hapten-carrier conjugates and anti-Hapten antibody;Lateral flow immunoassay (LFIA);	2-2.5

Introduction-Food safety and small molecule detection

Food can transmit disease from person to person by serving as a growth medium for food contaminations that can cause food poisoning. Food safety refers to non-toxic, harmless of food, in line with the nutritional requirements, and does not cause any acute, subacute or chronic hazards on human health. Currently, food safety is a growing concern all over the world especially in developing areas. Ensuring the safety of food has become a significant challenge due to globalization of the food supply and the demand for minimally processed food products. Some potential sources for chemical and biological contamination of foods include: the use of pesticides, fertilizers, and antibiotics around agricultural food products; accidental introduction of additives to industrially processed foods at unsafe levels, or intentional adulteration with low quality or unsafe ingredients for economic purposes; cross-contamination with allergens or other substances that can be dangerous to sensitive individuals (e.g., wheat gluten); microbial growth deriving from unsanitary agricultural or processing conditions; and spoilage during transport and storage of foods due to packaging defects or incorrect handling by consumers. To manage food safety risks, there is a continued need for rapid, sensitive, inexpensive, and reliable techniques to detect the presence of chemical contaminants and microbes in complex media.

Food Safety Solutions

Food testing and analyzing plays an important role in quality control of food production.

1. Culture-based traditional techniques

Traditional culture methods use selective liquid or solid culture media to grow, isolate, and enumerate target microorganism and simultaneously prevent the growth of other microorganisms present in the food (Jasson et al., 2010). These methods for the identification of foodborne pathogens involve pre-enrichment growth, selective enrichment culture, and selective plating followed by biochemical identification and serological confirmation of results. These methods are relatively inexpensive, sensitive, and still regarded as gold standards, the main drawback of these methods is their long analysis time and labor intensiveness. The whole procedure takes typically between 7 and 10 days (Vunrcrant and Pillustoesser, 1987; Biswas, 2005).

2. Microscopic and optical characteristics based methods

Various methods based on microscopic and optical characteristics of the appropriately stained microbial cells have been developed for assuring microbial safety of foods and food products. These methods include Direct Epifluorescent Filter Technique (DEFT), Flow Cytometry, and Solid Phase Cytometry. DEFT is a rapid method for enumerating microbial foodborne pathogens and is used widely in the dairy industry for raw foods (Hermida et al., 2000), milk and milk products, beverages, foods, etc. Flow cytometry is applied for the enumeration of viable bacteria in a sample, and uses fluorescent dyes for the analysis of viability, metabolic state, and antigenic markers of bacteria. Solid-phase cytometry (SPC) combines the principles of epifluorescence microscopy and flow cytometry.

3. Immunological methods

All immunological methods for the detection of foodborne pathogens are based on antigen–antibody reactions. The body produces specific antibodies in response to invading pathogen. These reactions are versatile and specific but the success of an immunoassay depends on the specificity of antibody. Various kits have been developed based on immunological methods for the detection of foodborne pathogens, and are available commercially and have been responsible for revolutionizing the field of food testing (Table 1).

4. Nucleic acid-based methods

Spurred by technological developments and commercial profit motives, nucleic acid-based assays have become widely available as powerful tools to assist in the diagnosis and monitoring of foodborne pathogens. These methods are based on the detection of specific gene sequences (signature sequences) in the genotype of target organism. The sequences may be selected in such a way that they can detect a particular group, genus, species, or even the strain of microorganism. There are many DNA-based assay formats, but probes and nucleic acid amplification techniques are the most popular ones and have been developed commercially for detecting foodborne pathogens.

5. Mass spectrometry

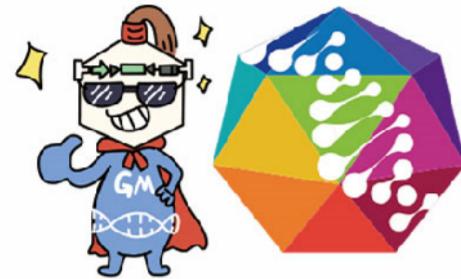

For years, mass spectrometry has been considered the most suitable analytical technique for the detection of multiple compounds in food, feed and water. Coupled to liquid chromatography (LC), high-performance LC and ultra-high performance LC (HPLC, UHPLC) or gas chromatographic (GC) separation with an ionization source such as electrospray (ESI), a large number of mass spectrometry-based methods were developed to comply with updated regulations. To effectively apply this approach, the structure of the compound must be characterized before its detection. Methods development can be time-consuming, and standards must be acquired to optimize compound-specific instrumental conditions, including transition selections, ion-source voltages, and collision energies. MRM methods are, therefore, unable to screen for unknown compounds

Small molecule detection-Hapten based competitive immunoassay

Small molecules such as pesticides, drugs, etc. are usually nonimmunogenic and hence do not elicit an immune response unless coupled with some macromolecules such as proteins. It is, therefore, required to modify these small substances (hapten) for coupling with macromolecules (carrier) so as to make a stable carrier-hapten complex. Synthesis of hapten for linking with carrier proteins is the most important aspect of specific antibody generation against small molecules for immunoassay applications.

About GeneMedi

We develop solutions for the therapeutics and diagnostics industry.

GENEMEDI
Innovative Solution
for Therapeutics & Diagnostics Industry

About GMole™

GMolecule-Innovative capabilities in molecular entity discovery and application development.

GMolecule is the capabilities derived from insight and expertise of Gene & Biologics molecular entity discovery and development. Our QbD process is combined and optimized with intelligent design, smart discovery, rational development, and State-of-the-Art manufacturing (D&D&D&M). Data management is separated independently for high-quality data certification. The modalities and facilities of GMolecule are including antibodies, recombinant protein, and multiple types of gene therapy vectors and delivery vehicles (AAV, lentivirus, virus-like particle(VLP), etc.).

About GTU&GDU

GTU&GDU, GeneMedi Therapeutics Unit & GeneMedi Diagnostics Unit, are GM's 2 unique product-solution units for the industry of therapeutics or diagnostics. Since the insight from GM's unique in-house database-GM target/biomarkers and diseases database, GM empowers self-capabilities for application development to develop more effective products and solutions to meet the needs of the therapeutics and diagnostics industry.

About GeneMedi ITD

ITD is GeneMedi's target-insight database that connects human indications/diseases/conditions with associated targets/biomarkers in diagnostics, therapeutics, and prognostics. ITD is a data-driven artificial intelligent system that learns from literature and in-house wet-dry exploration with closed-loop design. GeneMedi ITD target-insight system robustly improves the development efficiency for therapeutics and diagnostics industry solutions.

GeneMedi BGM-X™ Innovative Engine

With years of modalities discovery insight and expertise in the pharmaceutical industry, GeneMedi has developed innovative BGM-X™ Engine for big data-driven scientific discovery and industrial development in modalities of biologics and gene therapeutics.

TAURUS™ PLATFORM FOR DIFFICULT TARGETS ANTIBODY DISCOVERY

GeneMedi's Taurus™-Antibody Discovery Platform is to achieve **Tough Antigen Unique-epitope Recognized with Unique Smart-immunogen strategy**.

LIBRA™-ANTIBODY ENGINEERING PLATFORM FOR ANTIBODY HUMANIZATION, MATURATION, AND RATIONAL EVOLUTION

LIBRA is developed with the characteristics: **Light, Intelligent, Balanced, Rational, and Algorithm-driven.**
